Single Instruction, Multiple Data (SIMD): A single operation (task) executes simultaneously on multiple elements of data. The number of elements in a SIMD operation can vary from a small number, such as the 4 to 16 elements in short vector instructions, to thousands, as in streaming vector processors.

It would eventually introduce a set of extended (opcode) instructions called SIMD. Today, modern microprocessors can execute the same instruction on multiple data. This is called Single Instruction Multiple Data (SIMD). SIMD instructions handle floating-point real numbers and also provide important speedups in algorithms.

A complex instruction set computer (CISC / 'sisk /) is a computer in which single instructions can execute several low-level operations (such as a load from memory, an arithmetic operation, and a memory store) or are capable of multi-step operations or addressing modes within single instructions. The term was retroactively coined in contrast to reduced instruction set computer (RISC) and has therefore become something of an umbrella term for everything that is not RISC, from large and ...

Each core can execute only one instruction at a time, however it's so fast it seems as if you are running multiple threads simultaneously. Threads that have messages waiting in the queue, are put into the "active pool" which uses the first in, first out prioritization technique in order to arrange which instruction should be called first.

A complex instruction set computer (CISC /pronounce as 'sisk /) is a computer where single instructions can execute several low-level operations (such as a load from memory, an arithmetic operation, and a memory store) or are capable of multi-step operations or addressing modes within single instructions, as its name suggest "COMPLEX INSTRUCTION SET".

A superscalar processor is a CPU that implements a form of parallelism called instruction-level parallelism within a single processor. In contrast to a scalar processor that can execute at most one single instruction per clock cycle, a superscalar processor can execute more than one instruction during a clock cycle by simultaneously dispatching multiple instructions to different execution units on the processor.

Also, in batch files, this feature can be used to put several commands on one if statement, as in this example: if not exist list.dat dir c:\in >list.dat & dir c:\out >>list.dat. If the file list.dat does not exist, then CMD runs the two dir commands in turn. This can simplify the batch program. There are two other ways to specify multiple ...
