### Easy To Use Chart of Periodic Table Trends

Periodic trends are specific patterns in the properties of chemical elements that are revealed in the periodic table of elements. Major periodic trends include electronegativity, ionization energy, electron affinity, atomic radii, ionic radius, metallic character, and chemical reactivity. Periodic trends arise from the changes in the atomic structure of the chemical elements within their respective periods (horizontal rows) and groups in the periodic table.

### Periodic trends - Wikipedia

The modern periodic table is based on the law that the properties of an element are a periodic function of their atomic number. These properties are related to the electronic configuration of the elements. We observe a common trend in properties as we move across a period from left to right or down the group.

### Essential Question: What are the trends on the periodic table?

The repeating structure of the periodic table outlines repeating trends in the physical and chemical properties of the elements. For instance, elements to the left of the table tend to have a more metallic character, while those to the right have a more non-metallic character.

Trends. Electronegativities generally increase from left to right across a period. This is due to an increase in nuclear charge. Alkali metals have the lowest electronegativities, while halogens have the highest. Because most noble gases do not form compounds, they do not have electronegativities.
